Las Loras Geopark Project is a local initiative that aims sustainable development using its extensive geological heritage as a tourism resource (geo-tourism). Currently, it is in a process of consolidation and integration into the UNESCO’s Global Geoparks Network.

Las Loras are spread over a wide territory between the provinces of Burgos and Palencia, dominated by highplateaus and hills that draw beeches lines into a mosaic of steppes, meadows and fluvial forests of great biodiversity.

Up to this time, there have been conditioned six signposted walking routes that allow maximum access to places of geological interest. A guide with the description of many of these places has also been published, along with other environmental or cultural places of interest.

Besides the scientific interest, the region boasts an extensive historical and archaeological heritage (Paleolithic sites, Neolithic dolmens and tumuli or archeological sites of the Iron Age) and a hidden place that encloses the time amongst their stones.
